Questions

1. How should users navigate between pages?

Ans: Users should navigate between the pages through a navigation bar, or primary buttons on the page. There should be a navbar at the top that can help navigate the users to any of the main pages of the website. There should not be any dead ends on the pages, each page should have some primary buttons which will redirect them to other pages on the website.

2. How will it be possible to find a specific book? Think of all possible alternatives and select at least two. Justify your choices.

Ans: To find a specific book the most natural way would be through a search bar with the title of the book, which would search through the catalog of books available in the library. Some people don't remember the title of the book, for these people searching

the author makes more sense. Having author pages with the books they have published will help them find the book they want. The other way to find books would be through an alphabetically ordered list with the title of the books. These ways are used to find specific books, while similar or good books can be found through different sorted lists which are sorted based on some factors like sales or categories.
